

Argumentative Essay on Global Warming

Everyone is familiar with Global Warming, yet the meaning is unclear to many. Global warming refers to a continuous increase in global warming. Various activities were performed that contributed to the gradual rise in temperature.

Global warming is essentially global warming caused by greenhouse gases. Greenhouse gases - mainly including carbon dioxide, water, nitrous oxide, methane - absorb and retain heat in the atmosphere.

Global warming has become a significant problem that requires unparalleled and immediate attention. It does not happen for just one reason, but a few reasons. Both causes are artificial and natural. Natural causes include exhaust gases, which can escape the earth, resulting in a temperature rise.

Thermal gases cause a greenhouse effect when evaporation covers the earth's surface, keeping the world warm. As a result of various human activities, a large amount of carbon dioxide forms in the atmosphere, absorbing most of the heat from the sun into the earth's atmosphere. The atmosphere should emit a lot of heat, but the greenhouse gases trap heat, not allowing it to escape from the atmosphere, causing the temperature to rise.

Volcanoes are also the cause of global warming - these eruptions release tons of carbon dioxide, contributing to global warming. In addition, methane is also a significant cause of global warming.

Excessive use of vehicles and the burning of fossil fuels cause increased carbon dioxide levels. Similarly, cattle farming and mining are also harmful to the environment. Deforestation is one of the most common problems that occur very quickly. So when the largest source of carbon dioxide, trees, disappears, there is nothing left to control the gas.

There have been two incidents in the last ten years in which the average high temperature was recorded. There are several reasons why people in today's society either accept or reject the idea of global warming. Some critics believe that all 'disaster' is just as fake as global crap and Y2K. The decline of aquatic species is also due to global warming.

Some think that biologists are psychologically influenced, by which humans are forced to make donations as a result. A US study by US CNN, with about 3,000 scientists in January 2009, found that most scientists agree that global warming is a reality, and it is a matter of urgency.

Since the Industrial Revolution, the average global temperature has risen by 1 degree Fahrenheit. Although it does not appear to be very large, studies have shown that large amounts of ice do not fall as temperatures rise slightly.

These relationships show that even small climate changes can cause significant problems such as global warming. Solving global warming may be a challenge, but it is not possible. It can be controlled even if the combined efforts of everyone stop it.
