

Argumentative Essay on Climate Change

Climate change refers to the changing global environment. Many internal and external forces have contributed to this. Climate change has become a global problem in the last few decades. Besides, these climate changes are affecting life on earth in various ways. These climate changes have different effects on the ecosystem and ecology. As a result of these changes, many plants and animals have become extinct.

When Did Climate Change Start?

The climate began to change long ago because of human activities, but we knew it 100 years ago. Over the last century, we have come to appreciate climate change and its impact on human life. We began researching climate change and eventually learned that the earth's temperature rises because of the so-called greenhouse effect. Global warming is causing more ozone depletion, affecting our agriculture, water supply, transportation, and a host of other problems.

The Reason for Climate Change

Although there are hundreds of reasons for climate change, we will only discuss the natural and human (human) causes.

Natural Causes

These include volcanic eruptions, sunlight, tectonic plate movements, orbital diversity. As a result of these activities, the environment becomes more and more dangerous for life. Also, these activities raise global temperatures to a large extent causing environmental inequality.

People's Reasons

Man, because of his need and greed, has done many works that harm the environment and himself. Many species of plants and animals have become extinct due to human activities. Harmful human activities include deforestation, natural oil, industrial waste, various forms of pollution, and much more. All of these factors adversely affect the climate and the ecosystem. And many species of animals and birds became extinct or threatened with extinction due to hunting.

Effects of Climate Change

The environment is suffering as a result of these climate changes. Sea level rises, glaciers melt, CO₂ emissions increase, forests and wildlife decline, and climate change disrupts water quality. Besides, it

is calculated that if this change continues, many species of plants and animals will become extinct. There will be substantial environmental consequences as well.

What will the future be like?

If we do nothing and things continue right now, there will come a day when people will disappear from the face of the earth. But instead of ignoring the problems, we are beginning to address when we can save the world and our future.

Although human error has caused much damage to the climate and ecosystem, it is not too late to start again and try to undo what we have done so far to harm the environment. And when everyone begins to contribute to the environment, we can be confident of our future existence.
