

Expository Essay on Global Warming

Introduction

Climate change, environmental destruction, whatever you want to call it, appears like an unstoppable monster that we're losing combat against. And even though the science behind it isn't always that simple, it's also not that difficult. We know what it is and of methods to change it and we've known this for a long time now.

There are actions that we can take ourselves, changes in our habits that can make a worthwhile difference to our naughty footprint if enough human beings include them.

However, do not let anyone inform you that the responsibility for solving the climate crisis lies completely in your own hands. It is a misleading and dangerous myth, specifically at a time where the repercussions and knock-on results of climate change are getting more and more visible around the world.

Nobody will deny that adapting your behaviour can assist, but the actual responsibility lies on the shoulders of the world's politicians and industrial leaders. These are the actual decision-makers and influencers, and ultimately determine which alternatives we're able to make.

How development is affecting climate

With global market incentives, measures and developments to tackle climate change have hardly ever been embraced as a particularly rewarding thing to do till now. Today there are endless developments in search of more solutions that you thought were needed. It is now a question of whether the creativity of our worldwide markets can overcome their conservative components and with an honest image and presciently provided by our global governors succeeds in protecting the livability of our world.

Unfortunately, things that don't often go well together are vision and economic growth. To some extent, they appear mutually unique, with vested interests and most of the people of global wealth still reliant on profit from traditional assets, there is still a crucial battle to be won.

A below-the-belt fight in opposition to false narratives and fake news that trivialize the severity of climate change, and would have you believe that it is your fault anyway. Acting solely in the name of profit and economic growth has brought the livability of the planet at risk and ushered in a generation of incredible inequality and insecurity, the solution to which has frequently been more of the toxic mix that created it as far because the livable planet is concerned. It's time for a healthier worldwide diet.

And though most people's world philosophies encompass more than just each person for themselves, market mechanisms on their own leave little sustainable room for anything else. This is where our elected representatives and lobbying for new environmental regulations come into play. As a global citizen, Silence and individual disgruntlement get us nowhere.

Five things you can do to Stop Global Warming

1. Get involved in your community

This is one of the great decisions you can make. Not only will getting more involved in your community help you to better apprehend its demanding situations and why things are carried out the way they are, but it could also afford you the opportunity to improve your surroundings which is incredibly rewarding. Organizing a normal beach cleanup is super easy to do and costs no money.

2. Buy local food and products from Sustainable sources

Buying local products might not be as easy because it sounds, but it offers massive benefits which include reduced transportation costs and effects, reduced packaging waste, and the stimulation of employment in local communities. Spending a bit extra money on organic and fair-trade products, or travelling a bit further to buy your groceries is a superb way to exercise your planetary decision-making power.

3. Plant a Tree or some flowers to help decorate the region around your house

This is an outstanding idea, and you should do it! But without trying to burst your bubble of excitement, this is currently an almost meaningless action. Approximately 205,000 acres of rainforest burnt every day. There are more than 150 acres of forest lost every minute of every day. If you want to plant some trees, please plant some trees. In case you want to do more than that, donate regularly to a reforestation mission or assist environmental activists. If you need to do even more, then reduce your meat consumption drastically.

4. Use Public Transportation for short Distances as an alternative to riding a vehicle

This does make a difference, and as a vehicle lover, I've to say it pains me to admit that vehicles are huge polluters. In some parts of the world, being without a vehicle may not be an option, but whenever possible, try to get a ride with someone else or use public transportation.

5. Turn off the water while brushing teeth and Showering to save on Water usage

Water is a problem. And it is getting bigger. A vicious cycle of higher temperatures, changes in rainfall and water contamination continue to increase global warming and further threaten our water supply.

Coca-Cola uses over 281 billion litres of water per year to make its drinks. So you would possibly say all of the water that you can save yourself isn't going to make much of a difference.

Turning off the water while brushing your teeth or showering is an easy way to reduce water usage.

Fortunately, change is coming as people from all corners of the world unite to stand up for things that matter to them. As we speak there are countless groups and individuals around the world who attain real change from the ground up. Environmental activists and human rights defenders need your support as they're our best route to lobbying for and achieving the big changes that need to occur.
